

Azure API Management Report (Step-by-Step)

Step 1: Create Web API in Visual Studio

- Open VS Code project
- Check Program.cs, appsettings.json

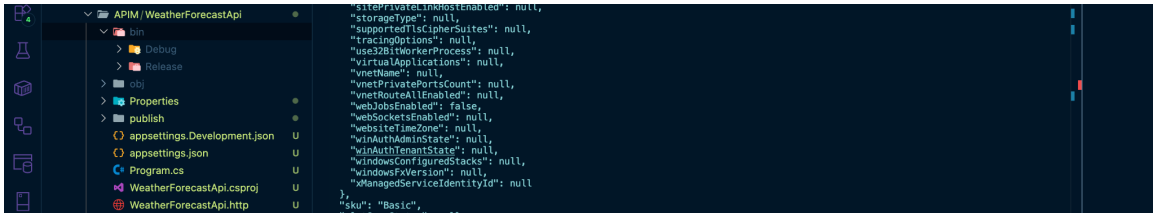

Figure: Step 1: Create Web API in Visual Studio

This image shows the project structure in VS Code including key files like Program.cs and appsettings.json used to configure the Web API.

Step 2: Publish API to Azure

- Publish → Azure App Service
- Enable APIM

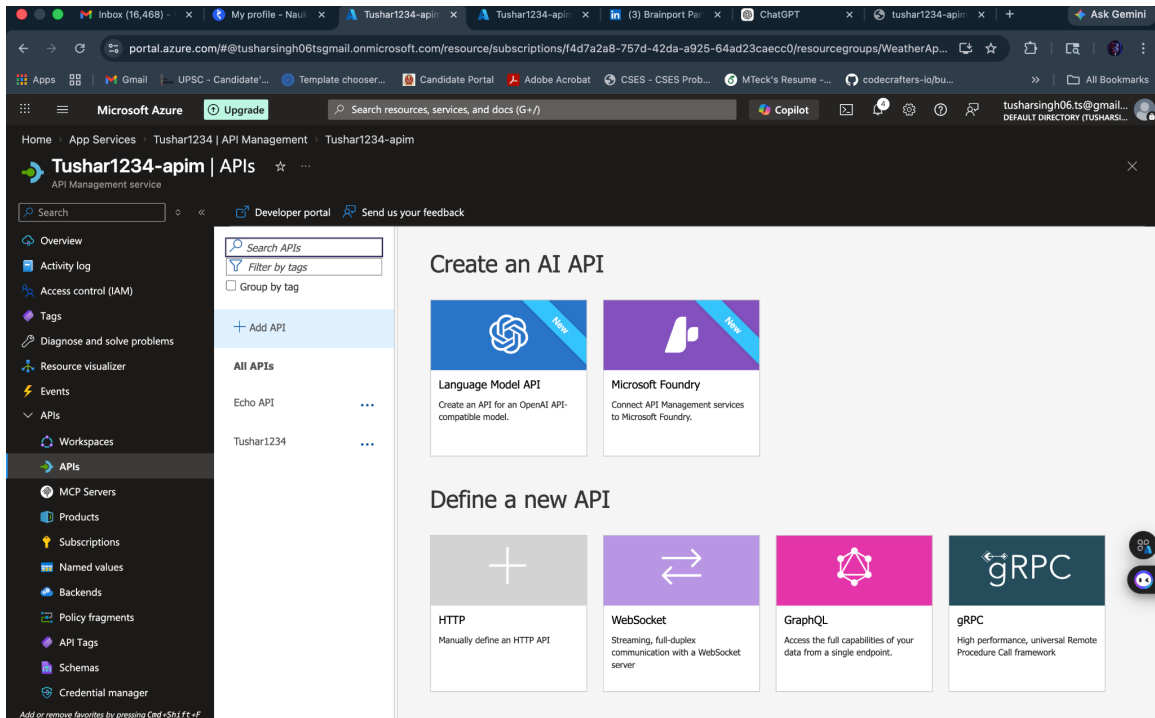

Figure: Step 2: Publish API to Azure

This screen shows the Azure API creation interface used during publishing where different API types like HTTP and GraphQL can be selected.

Step 3: Resource Group

- View all resources

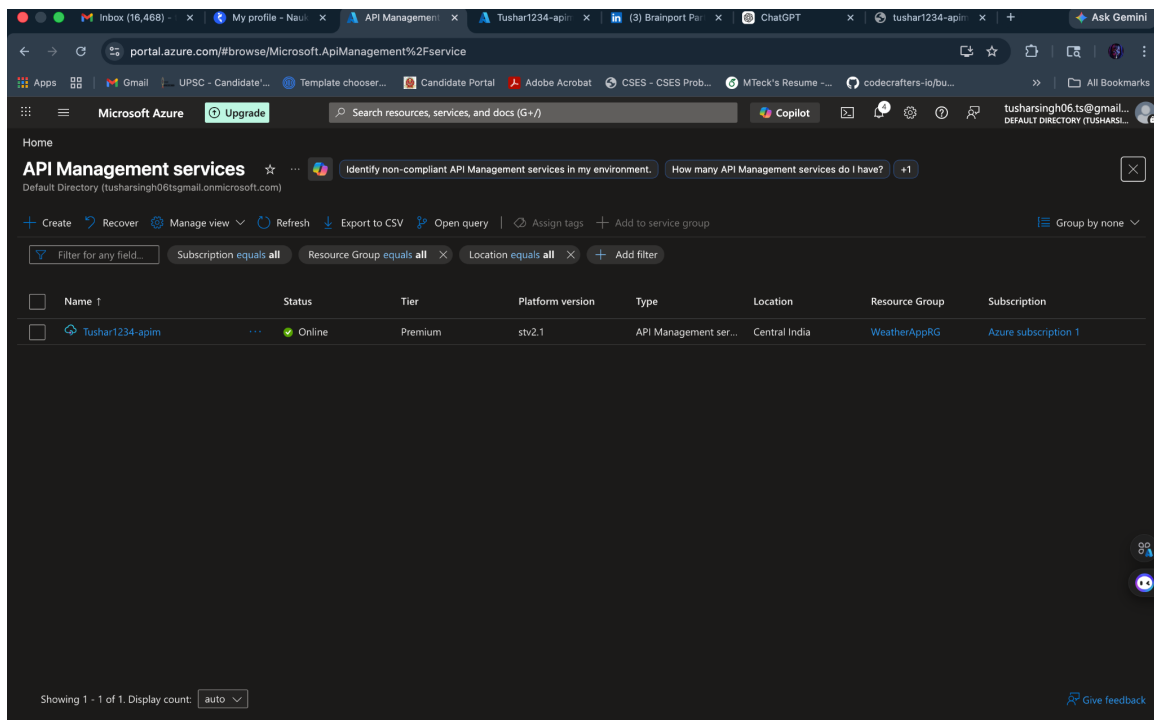

Figure: Step 3: Resource Group

This screenshot displays the resource group containing all deployed services such as App Service, API Management, and App Service Plan.

Step 4: APIM Service

- Check gateway & status

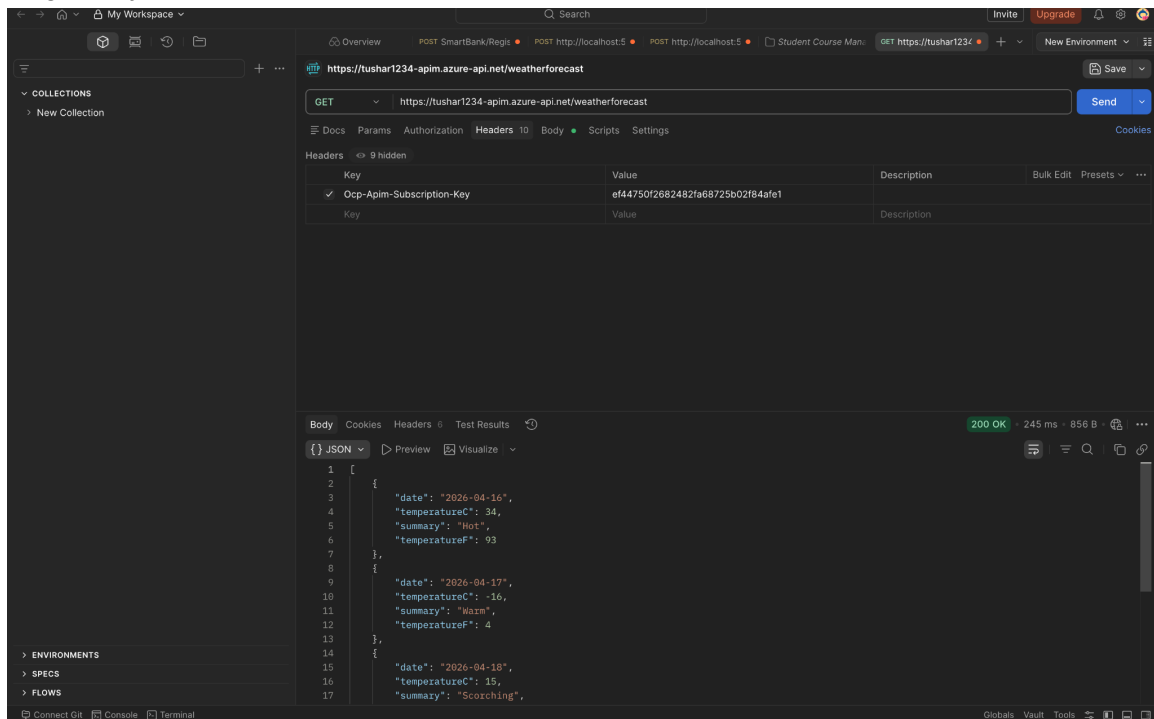

Figure: Step 4: APIM Service

This shows the API Management service overview including gateway URL, status, and subscription details.

Step 5: APIs in APIM

- Verify operations

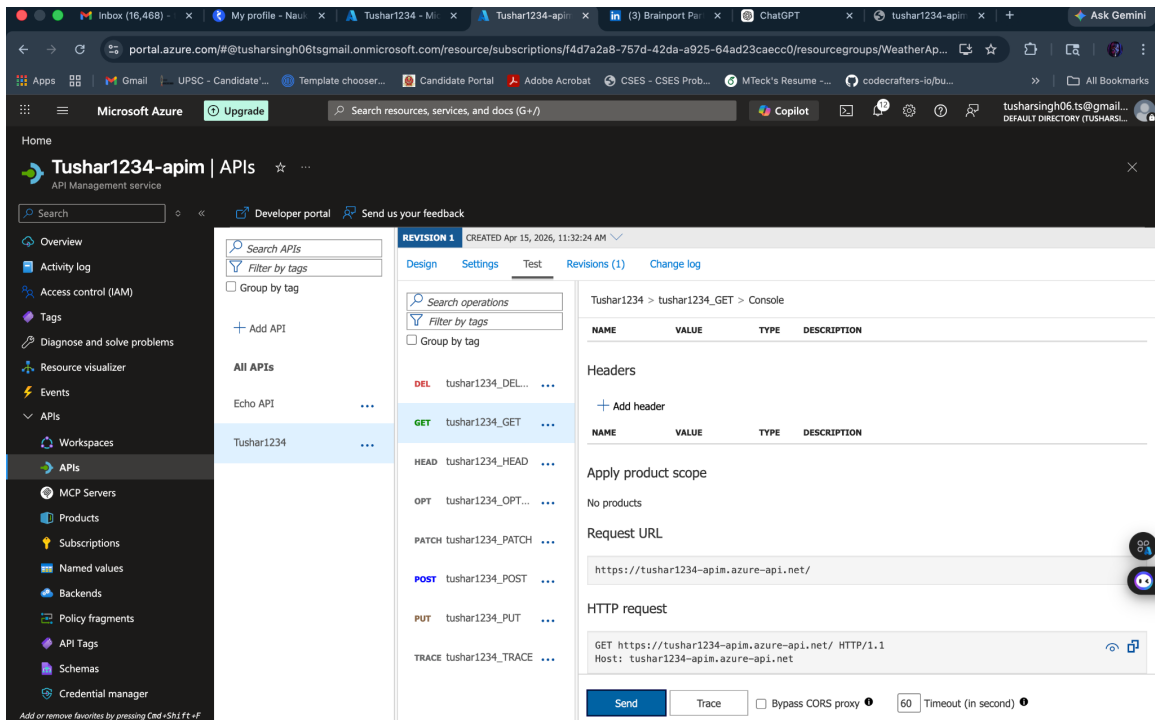

Figure: Step 5: APIs in APIM

This screen lists all APIs and their operations inside APIM, confirming successful API integration.

Step 6: Test API

- Send GET request

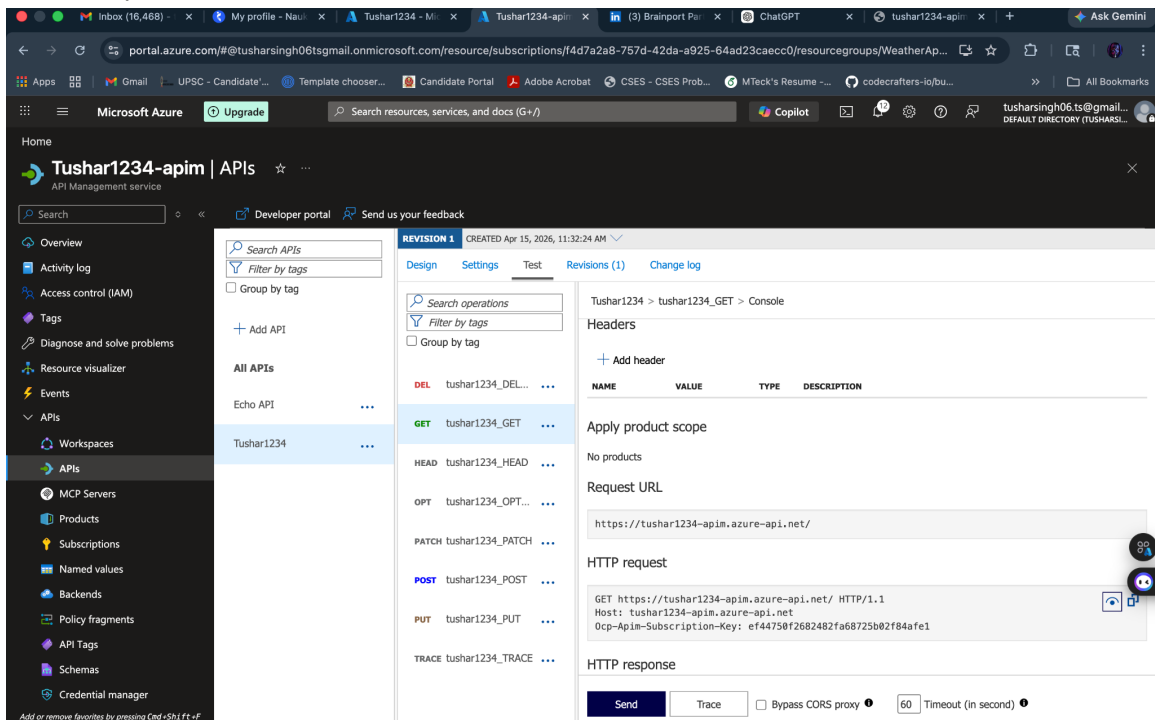

Figure: Step 6: Test API

This shows API testing within Azure Portal where a GET request returns JSON data successfully.

Step 7: HTTP Details

- Check headers

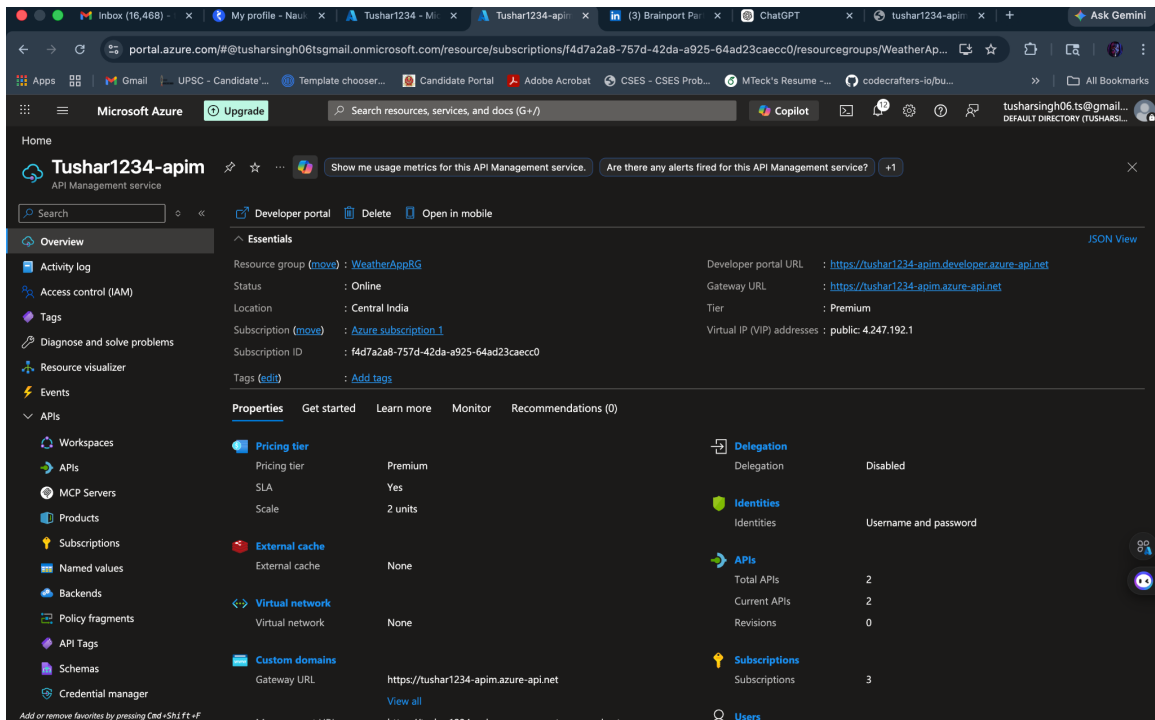

Figure: Step 7: HTTP Details

This image highlights HTTP request details including the subscription key used for authentication.

Step 8: Postman Test

- 200 OK response

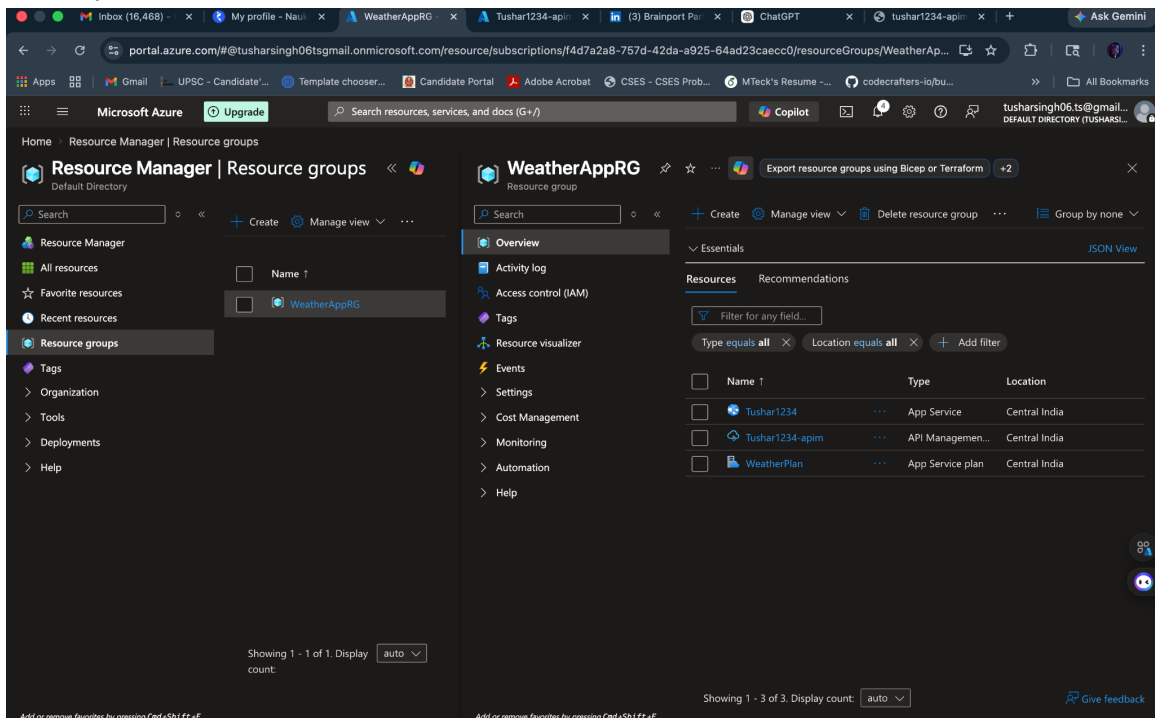

Figure: Step 8: Postman Test

This shows successful API execution in Postman with status 200 OK and valid response.

Step 9: Rate Limit Policy

- Apply XML policy

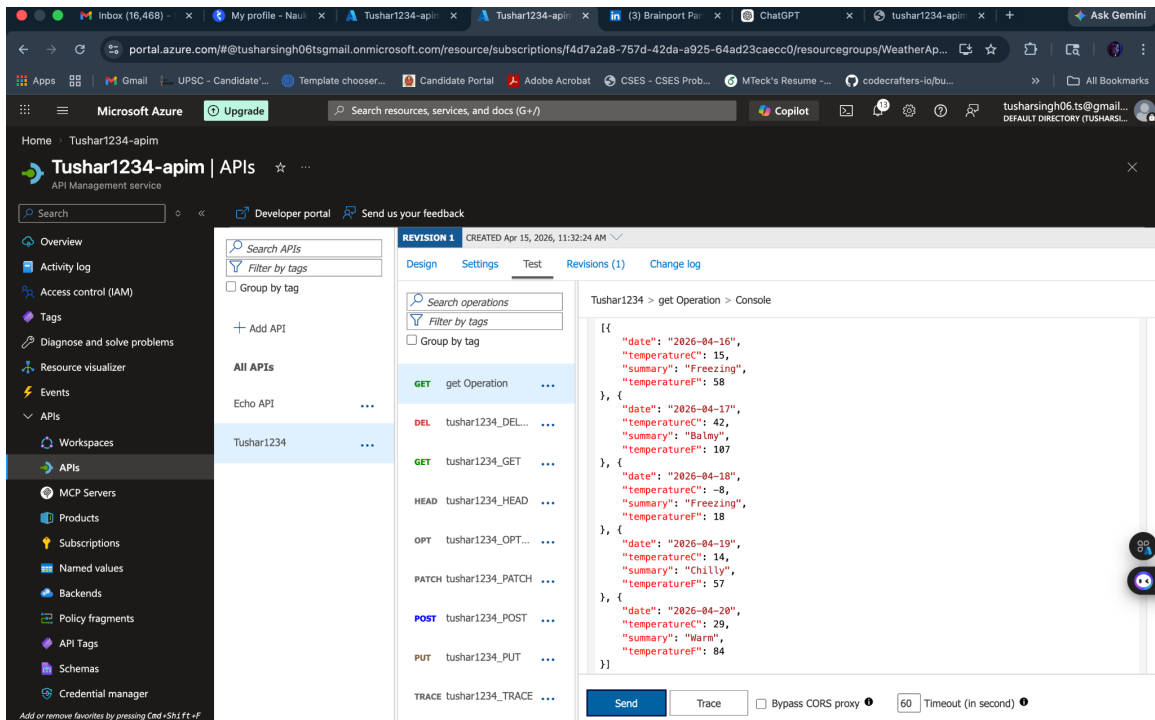

Figure: Step 9: Rate Limit Policy

This screenshot displays the policy editor where rate limiting is configured using XML.

Step 10: Rate Limit Check

- Trigger limit

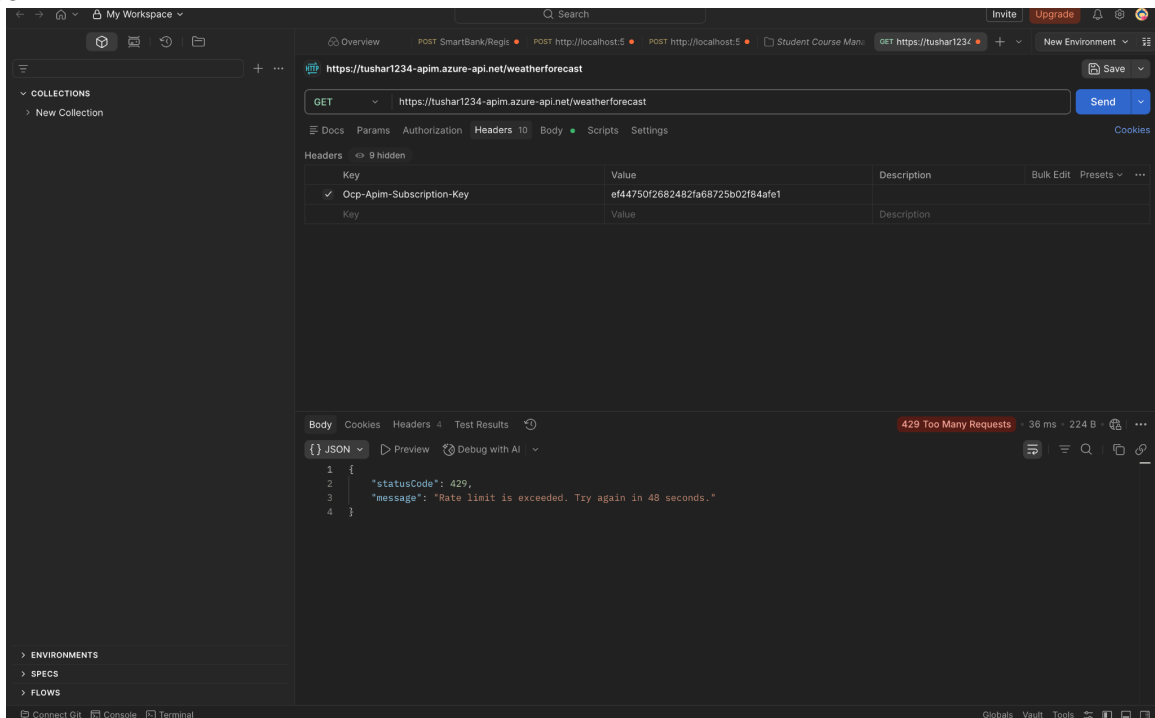

Figure: Step 10: Rate Limit Check

This shows enforcement of rate limiting after multiple API requests.

Step 11: Error Response

- 429 Too Many Requests
